

solves this problem:

Continuous integration / deployment

A software tool (just like docker, git)

Problem:

long compilation

example: c++ project

20 minutes to compile

you won't be able to code during compilation

test project:

predefined tests

or you can manually test yourself

This can also take a long time

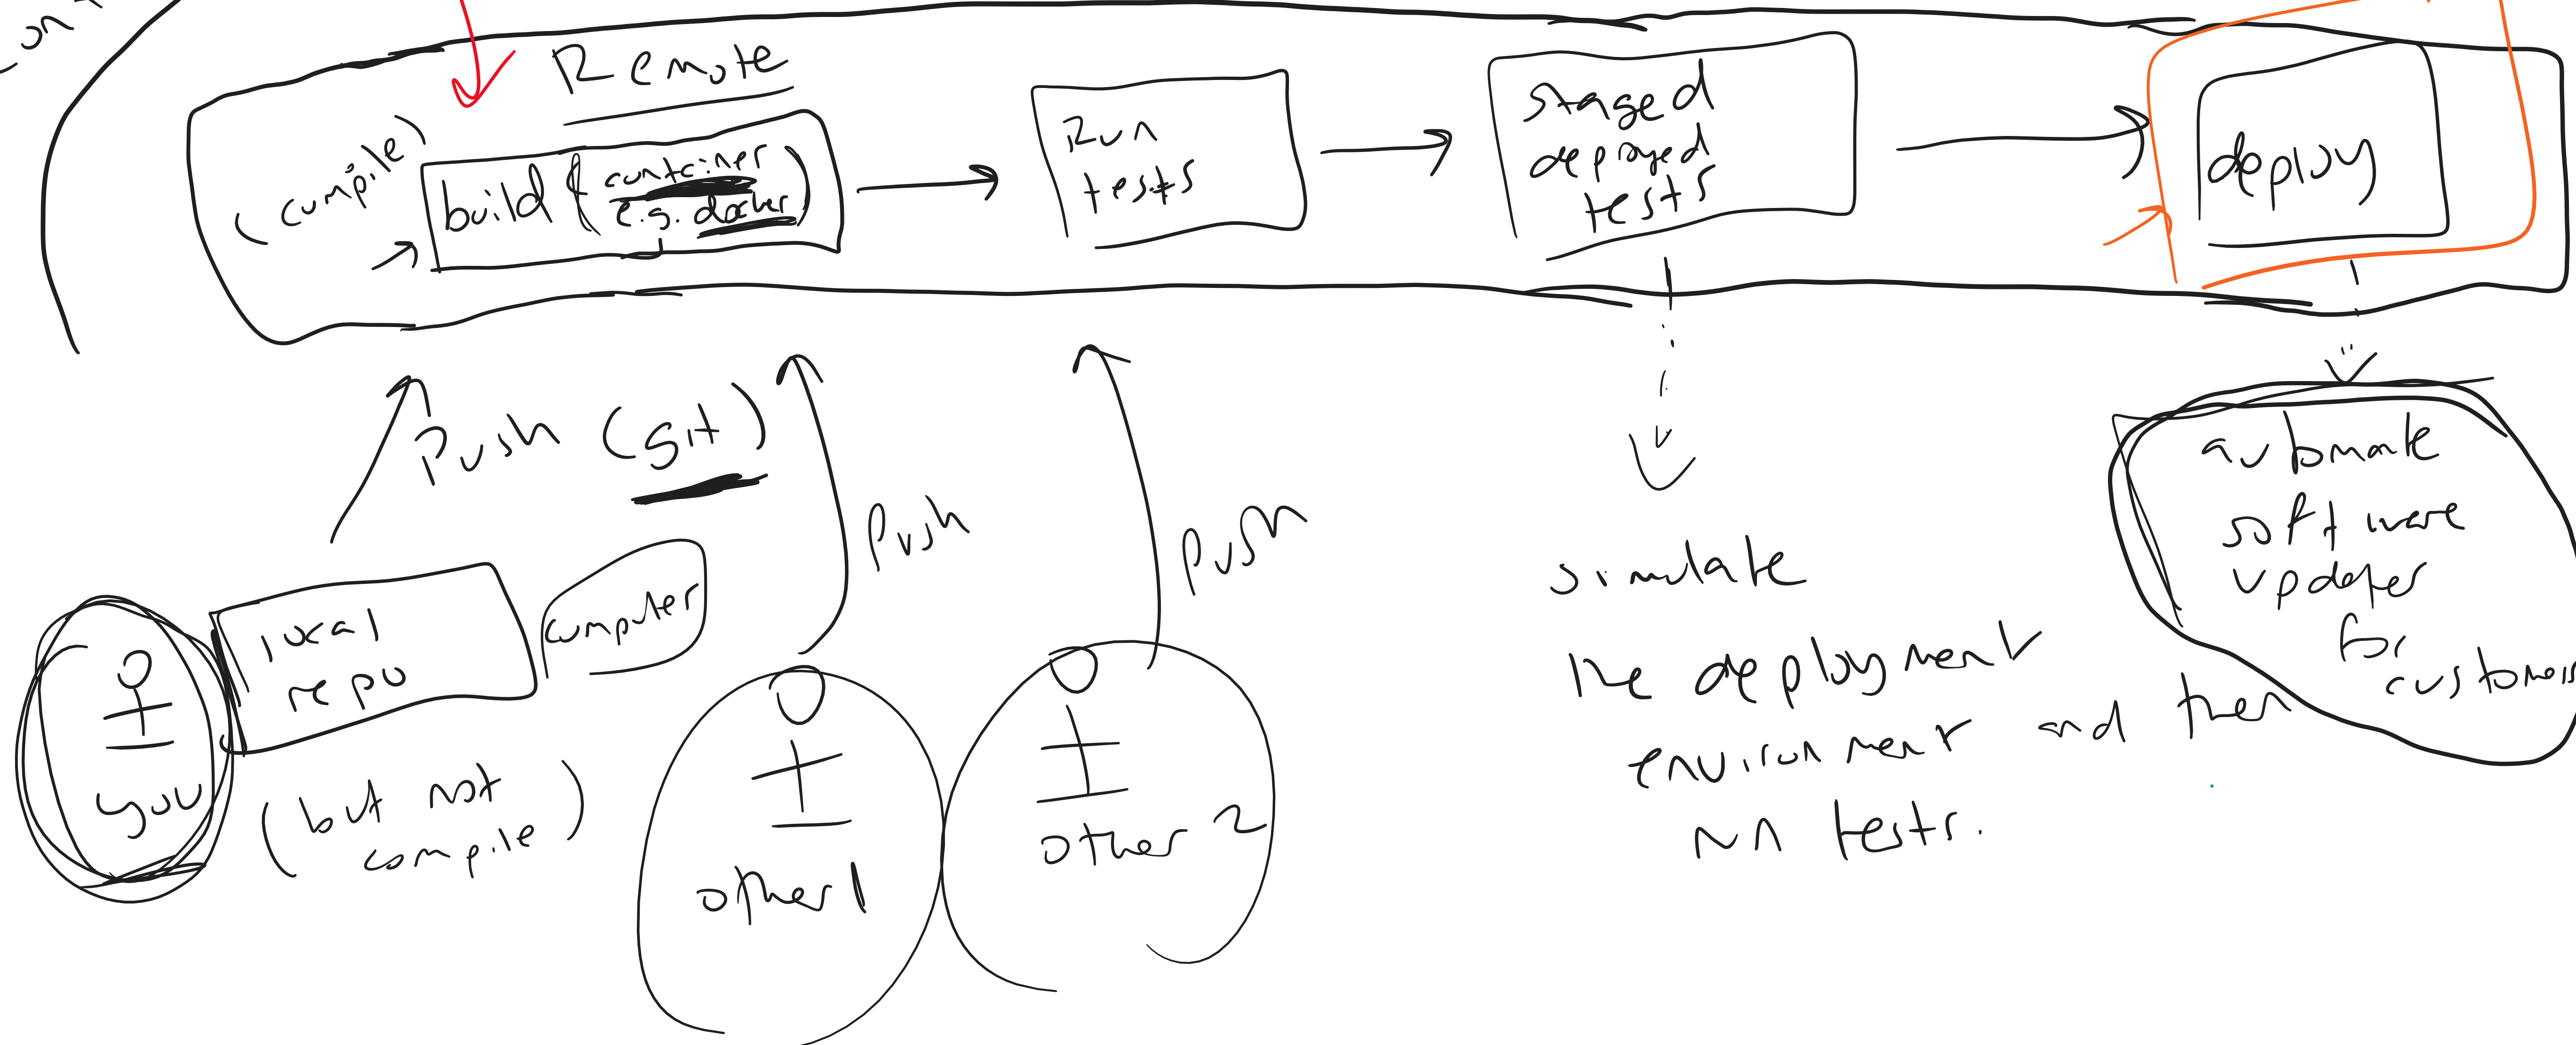

1 hr to test

very inefficient

every change comes with a cost of 1 hr and 20 min

continuous integration

continuous deployment

aws server

heroku

location to deploy

Project (software architecture)
to do list / weekly schedule
